CampusAssist Use Case Document

GPT Name

CampusAssist – College Student Support Assistant

CampusAssist is a conversational Custom GPT designed to answer common college-related questions using official college information.

It will support queries about attendance, examinations, assignments, leave procedures, college rules, and academic processes.

Target Users

Primary Users

- **College students:** Need quick answers about attendance, exams, assignments, leave policies, and college procedures.
- **Newly admitted students:** Need guidance on college rules and academic processes.
- **Final-year students:** Need information about project submissions and academic deadlines.

Secondary Users

- **Faculty members:** Help students access academic guidance and reduce repeated questions.
- **College administrative staff**: Support consistent answers about college policies and procedures.
- **Student affairs coordinators**: Help direct students to the appropriate department when needed.

Problem Statement

College students frequently ask repetitive questions about attendance requirements, examination schedules, assignment deadlines, leave policies, college rules, and academic procedures because relevant information may be difficult to locate in one place.

Consequently, faculty members and administrative staff spend time responding to similar inquiries, increasing their workload and potentially delaying students' access to the information they need.

Expected Outcomes

The following are proposed target goals, not measured results:

1. **Reduce repetitive queries:** Target a 30% reduction in repetitive questions received by faculty and administrative staff during the pilot.
2. **Provide faster responses:** Target answers to common questions within 2 minutes per query.
3. **Cover common questions:** Prepare coverage for at least 50 frequently asked questions.
4. **Achieve answer accuracy:** Target at least 90% correct responses on a predefined test set checked against approved college documents.
5. **Encourage adoption:** Target participation from at least 30 students during the pilot.

Performance should be measured during testing and the pilot. Query reduction should be assessed by comparing inquiry counts over comparable periods before and after implementation.

Required Knowledge

CampusAssist will need reliable, current, and approved college information, including:

- Attendance requirements and examination schedules.
- Student leave policies and college rules.
- Assignment deadlines and academic procedures.
- Frequently asked questions and official department contact information.
- Project submission guidelines and fee payment procedures.

Knowledge inventory status: The availability of these documents has not yet been verified. Obtain approved copies from the relevant college departments, confirm that they are current, resolve conflicting information with the responsible department, and create an FAQ document for common questions not covered by existing sources.

Validation Result

Validation Criteria

No.	Validation Question	Pass Condition	Status
1	Is the problem clearly defined?	A new reader can understand the problem, its cause, and its impact.	PASS
2	Is a Custom GPT suitable?	Conversational knowledge assistance provides value by answering common student questions	PASS
3	Is it feasible to build?	Required information exists or can be obtained from official college sources.	PASS - CONDITIONAL

Validation Notes

- **Clarity — PASS:** The problem statement explains repetitive student queries, difficulty locating information, and additional workload for staff.
- Suitability — PASS: A Custom GPT can answer natural-language questions using approved college documents**.**
- **Feasibility — PASS, conditional:** Required information can reasonably be collected from college departments, but the actual documents have not yet been verified. They must be obtained and checked before implementation.

Final Decision

Validation Status: PASS

Implementation Status: READY FOR TOPIC 2 — conditional on collecting and verifying the required official knowledge documents before configuration.

The use case meets the clarity and suitability criteria. Feasibility is accepted because the required information can be obtained, but knowledge readiness remains pending until the source documents are checked.
